Financial Harmony: A Checklist for New Couples

When there are financial decisions to be made it's important to know where you and your partner stand. The sooner you talk about tough issues like money, the stronger your relationship will be and the sooner you can begin working together to maximize your financial freedom, comfort and security.

Here are a few ideas for new couples:

- Schedule a date to discuss finances. Talk about your earnings, debts, spending and saving habits.
- Develop a budget together. It's the starting point for balancing income and expenses, discussing your plans, and reviewing your financial history.
- Compromise through differences. One of you might be a saver and the other a spender. Create a budget for both.
- Discuss your dreams and goals with each other and how you hope to achieve them.
- Review your investments jointly. Decide if you need to change your investment allocations.
- Make sure you understand where you both want to spend your money.
- Discuss responsibility for paying the bills and balancing the checkbook. How will you collaborate on decisions for larger purchases?
- Don't hide things from each other. It might end up hurting you in the long run.

After you discuss your finances, it's a good idea to set-up an appointment with your financial advisor to discuss your options as a couple. The goal is to establish shared values and a plan for financial security.

Inside The Economy

Key Perspectives: Our Economic Outlook, February 2017

The election made investors far more optimistic about the future, but economic improvement will not be easy. Repeatedly over this cycle, optimism about faster growth has fallen victim to economic challenges both in the United States and abroad.

Collapsing energy exploration and production reduced growth in the United States as that sector adjusted to lower oil prices. Consumer spending may have improved partially as a result of lower energy costs, but spending clearly outdistanced income in 2016. When that happened in the past, spending has slowed to match incomes. Like many measures of hope for the future, consumer confidence soared in the wake of the election. For optimism to translate into sustainable spending gains, however, consumers will need stronger income growth.

If anything, businesses became even more confident than consumers as a result of the election. A Conference Board survey of CEOs shows that confidence increased sharply. With hopes of new spending programs, reduced tax rates and regulatory simplification, it is not surprising that businesses would be enthusiastic. Still, most businesses will want to see results in Washington before they modify their own business plans.

Service industries have provided a solid base of growth for the U.S. economy, in part because they have been less affected by excess capacity and the competitive pressures of selling overseas. But it was the improvements in manufacturing, due to energy's rebound and a better global outlook, that generated the most significant change in 2016.

Most overseas economies now show better growth. As in the United States, manufacturers still struggle with a significant excess of manufacturing capacity, but improving output has alleviated the anxiety about global recession.

In summary, the (partial) rebound of energy activity has helped the U.S. industrial economy rebound. Accelerated consumer spending also helped, as consumers have spent on cars, housing and other goods. Although U.S. exporters are still fighting the effects of a strong dollar, improving economies overseas have at least generated stronger international demand. Earnings growth also seems to have turned the corner, so earnings reports could provide better support for equity prices in the coming months.

Still, inflation has as risen as energy prices rebounded, which makes rate hikes more likely. With an aging economic cycle, rising interest rates and some tightening of lending standards the headwinds to growth over the coming months may be stronger than many economic observers expect.
